

AI Usage DISCLOSURE FORM

Project: AURA — Interruptible Real-Time Agent | Samsung PRISM Generative AI Hackathon 2026–27, Theme 05

1. Team Details

Team Name: **MSRIT_An Apple a Day**

Project / Product Name: **AURA — Interruptible Real-Time Agent (Samsung PRISM Theme 05)**

Organization / Institution (if any): **MS Ramaiah Institute of Technology (MSRIT)**

Submission Date: 04/10/2026

2. AI Usage Declaration

Did your team use any Artificial Intelligence (AI) in developing this project?

*AI was used strictly as **development assistance** (suggestions, drafts, reviews). All architecture decisions, implementation choices, integration, testing, debugging, verification and final approval were made by the human team members. No AI system runs in the AURA prototype itself beyond the agent functionality the team designed and built.*

3. Purpose of AI Usage (Brief Details)

Idea generation / brainstorming:

Yes — ChatGPT: brainstorming and refining implementation approaches (interruption handling, state-versioning strategy, demo workflow). Human team selected and approved all approaches.

Code generation or assistance:

Yes — ChatGPT and AI coding assistants (including OpenCode): drafting and modifying frontend (React/TypeScript) and backend (Python) code, UI/UX implementation help, debugging and test assistance. Every change was reviewed, integrated, tested and approved by the team.

UI / UX design:

Yes — AI assistance for the glassmorphism design system, 9-page layout, dark/light theme system and demo presentation. Final visual and interaction decisions by the team.

Content creation:

Yes — README drafting, presentation/demo content assistance, structuring technical explanations. All content reviewed and finalized by the team.

Data analysis:

Not applicable — no datasets were analyzed with AI tools; the prototype uses deterministic mock data and scripted demo scenarios only.

Testing / debugging:

Yes — AI assistance in writing tests and diagnosing failures. Tests were executed by the team; results verified against the repository (110-test backend manifest, zero failures recorded).

Other:

Reviewing implementation approaches and demo/verification strategy with AI assistance; human team retained all engineering decisions.

4. Feature Origin Classification

*All features below are classified **Both** (human-designed and human-built with AI assistance). AI did not independently design, decide, or verify any feature. Exact historical prompt transcripts were not retained; prompts were task-directed requests issued during development sessions.*

1. Feature Name: Interruptible execution architecture (Fast Path / Slow Path / Coordination Layer)

Self-Generated / AI-Generated / Both: **Both**

Description: Both (human architecture + AI implementation assistance) — Tools: ChatGPT, OpenCode. Output: drafted coordination logic and event flows. Modification: team designed the layering, rewrote/integrated the code, and verified behavior through tests and demo runs.

2. Feature Name: Session state management, versioning and stale-result rejection

Self-Generated / AI-Generated / Both: **Both**

Description: Both — Tools: ChatGPT, OpenCode. Output: drafted state-manager code and version-gating logic. Modification: team fixed the semantics (monotonic versions, binding, invalidation) and verified with state/version contract tests.

3. Feature Name: Tool Registry, lifecycle, cancellation, idempotency and commit boundaries

Self-Generated / AI-Generated / Both: **Both**

Description: Both — Tools: ChatGPT, OpenCode. Output: drafted registry, manifests and mock providers. Modification: team defined commit/idempotency semantics, fixed race handling, verified with lifecycle and idempotency tests.

4. Feature Name: Multimodal perception and verification grounding

Self-Generated / AI-Generated / Both: **Both**

Description: Both — Tools: ChatGPT, OpenCode. Output: drafted STT/vision/verification/grounding modules. Modification: team enforced 'perception proposes, verification commits' with confidence gates and version guards, verified with multimodal safety tests.

5. Feature Name: React/TypeScript frontend (9 pages, glass UI, dark/light themes, demo workflow)

Self-Generated / AI-Generated / Both: **Both**

Description: Both — Tools: ChatGPT, OpenCode. Output: drafted components, pages, styling and theme system. Modification: team directed layout/behavior, reviewed every page, verified with clean strict builds.

6. Feature Name: Demo workflow and trace/event logging

Self-Generated / AI-Generated / Both: **Both**

Description: Both — Tools: ChatGPT, OpenCode. Output: drafted scripted interruption scenario and event feed. Modification: team defined the canonical Delhi→Mumbai demo and verified the event sequence.

7. Feature Name: Documentation, README and presentation content

Self-Generated / AI-Generated / Both: **Both**

Description: Both — Tools: ChatGPT. Output: drafted docs and slide content. Modification: team verified every claim against the repository and finalized the wording.

5. Ethical & Compliance Confirmation

AI usage complies with guidelines and policies. **Yes** ■

No proprietary or copyrighted data misused. **I Agree** ■

No third-party proprietary data, copyrighted assets, or user data were used in development. All demo data is synthetic/mock. AURA's runtime agent behavior was designed and built by the team; AI tools were used only

during development, not in production.

6. Declaration & Sign-Off

Name of Team Representative: Udbhav Shukla

Role: AI/Backend & Full-Stack Integration Lead

Signature: _____
